

Image Curation — what my portfolio needs, and what I rejected

FlyRank AI-Fluency · Week 3 "Curate Your Images" · Alex Ji · 2026-07-13 · kit: IBM Plex + slate/teal

1 · Image map (matched to my sitemap)

Section	Image it needs	Type	Source / status
Hero	Background texture (faint agent-node lattice)	AI / designed	KEEPER — hero-keeper.png (this kit's style)
Work — Orallexa	The 5-voice debate output, or the 54★ repo header + test badge	REAL capture	Alex to capture (shot list §4)
Work — Solo Founder OS	PyPI page / <code>pip install</code> + test run, or the repo README	REAL capture	Alex
Work — Shadow	A <code>/api/deliberate</code> JSON + hash-chain audit, or MCP tools inside Cursor	REAL capture	Alex
Section markers	4 line icons (agents / stack / audit / CTA)	AI / designed	KEEPER — icons.png
About	A photo of me	REAL photo	Alex's real headshot
Contact	None — a CTA button, no image	—	—

2 · The connective-tissue set (AI/designed — one consistent style)

Same slate + teal, same restraint — a **set**, not a **pile**. The hero recedes so the work is the loudest thing.

3 · Rejected — the discernment call

Rejected this hero. A colourful gradient-mesh "AI-startup" texture.
Why: it's the exact generic AI-slop aesthetic every vibe-coded landing page ships; it's *louder* than my work and breaks my own "calm frame" rule; and its rainbow palette blows up the slate+teal kit — it would read as bought, not built.

Kept the lattice instead. The faint agent-node graph reinforces the multi-agent story *quietly*, stays in-palette, and recedes behind the claim and the real screenshots.

4 · Where I chose REAL captures over AI (and the shot list)

Every **work** image is a real screenshot — never generated. My whole pitch is "you can audit my work," so a fake dashboard would undercut the one thing I'm selling. AI is used only for texture + icons; the proof is always real.

Real captures I'll take (in my logged-in browser — clean, cropped, legible):

#	Shot
1	Oralexia — live demo (<code>orallexa-ui.vercel.app</code>) 5-voice debate, OR the GitHub header showing 54★ + 1,300+ tests badge
2	Solo Founder OS — PyPI page or a terminal <code>pip install</code> + green test run
3	Shadow — a <code>/api/deliberate</code> JSON response + the hash-chain audit, or the MCP tools in Cursor/Claude Desktop
4	About — a real headshot (neutral background)

Note: I tried auto-capturing the GitHub/live pages headlessly; they need a real logged-in browser for a clean, legible shot (bot-protection + JS render) — which is the right call anyway: real captures should be mine, not a machine's blurry grab.
